Content: To create a Software Requirements Specification (SRS) document for your web application, you can follow these steps:

1. Introduction: Provide an overview of the project, including its purpose, goals, and objectives. Describe the intended users and any relevant background information.

2. Functional Requirements: Specify the core features and functionalities that the web application should have. This may include user registration, authentication, product catalog management, shopping cart functionality, payment integration, order management, etc.

3. Non-Functional Requirements: Define the performance, security, usability, and other non-functional aspects of the application. This could include response times, data encryption requirements, secure connections (HTTPS/SSL), user authorization levels or permissions, accessibility standards compliance, etc.

4. User Roles and Permissions: Identify different types of users that will interact with the application (e.g., customers, vendors), and specify their roles and permissions within the system.

5. System Architecture: Describe the overall architecture of the application, including components/modules involved
